## ABSTRACT

The purpose of this project is to develop a computer based trainer (CBT) for ANVIS/HUD that takes advantage of recent advances in multimedia technology. Integration of a head mounted display (HMD) into the CBT system allows the user to be immersed into a virtual world that simulates actual NVG use. In accordance with guidelines established by Ciavarelli, Baer and Sengupta, in their NVG Training Technology Report, December 1994, for the Naval Aviation Systems Command (PMA 205) and using Macromedia Director 6.0, it is possible to incorporate a synthesized continuous multimedia data base into a system that permits user interaction along a scripted NVG flight path. The system has the capability of demonstrating some of the capabilities and limitations of an actual ANVIS/HUD system under user selectable lighting and terrain features. By utilizing commercial off the shelf (COTS) software and hardware the system represents a possible low cost, personal computer (PC) based, ANVIS/HUD trainer.

## **I. INTRODUCTION**

### **A. PURPOSE**

This thesis project is part of ongoing research and development sponsored by NAVAIR (PMA- 205). Its purpose of which was to develop and test advanced training systems for naval aircrews. The primary aim of this thesis was to design and develop a working prototype demonstration system for teaching aviators how to effectively and safely use a new night vision aiding system, the Aviator's Night Vision Imaging System/Heads Up Display (ANVIS/HUD).

### **B. BACKGROUND**

As previously stated by Kern and Shaffer, 1996:

The recent downsizing within the Department of Defense has forced most fleet aviation components to operate with minimum resources. A prevailing working doctrine stating that we "must do more with less" dictates that aviation commands must meet readiness goals as efficiently as possible.

The Navy, along with the other services, has often relied on advanced technology to improve efficiency and force effectiveness. An underlying assumption is that our forces can use technology to their benefit in attaining readiness goals and improving mission performance. However, while technological advances may provide a potentially greater tactical advantage for the pilot, they also impose on the pilot a greater burden for understanding a wide variety of equipment and theory. In short, today's aircrews are under more pressure than ever to understand the constantly changing number of assets that are available to them, hence the training systems that are delivered to the fleet must be efficient, cost effective, and as high a quality as the aircrews who use them.

Training aviators has become a highly visible task, and when this training involves night operations, the training procedures are scrutinized even more. In particular, the historical costs of neglecting night vision training, in terms of both personnel and material losses, demand more effective training methods. Fleet components may not always have the manpower to properly train all aircrew on night vision equipment. This being the case, either the quality of training suffers – and safety is sacrificed – or a better way to train is developed. Computer-based

applications are quickly becoming part of the answer to many of the fleet's training problems because (1) these applications provide a means to standardize training, and (2) They deliver needed training at the unit level.

A number of NPS theses have recently been written on the development and use of multimedia trainers for use with Night Vision Goggle (NVG's) and Heads Up Displays (HUD's). In 1994 Epperson and Meza developed a system that incorporated the opportunity for the user to open windows to view video. In 1996 Kern and Shaffer developed the HH-60H ANVIS/HUD baseline training system. Their trainer did not incorporate multimedia features. Later in 1996 and early 1997 Price and Foster expanded on Kern and Shaffer's work to introduce an improved user interface. This prototype also included windows for video playback. All of these previous CBT systems had in common an SVGA computer monitor as the primary output device to the user. The output imagery itself was primarily a mix of graphics, photography and text with minimal opportunity for interaction. The primary purpose of our project was to explore the practicality of adding interactive video displayed in a Head Mounted Display (HMD), also known as a Virtual Reality helmet, to improve the realism and value of the training provided. The project was limited to relatively low cost options for practical reasons and because the resource constraints were consistent with the current fiscal reality of fleet budgets.

### **C. PROBLEM STATEMENT**

Further multimedia enhancements to the ANVIS/HUD trainer were desired that would allow trainees to visualize the use of the ANVIS/HUD under more realistic flight conditions.

## **D. GENERAL APPROACH**

In the earlier work on NVG training by Ciavarelli, Sengupta and Baer (1994) the elements of a prospective multimedia NVG/HUD trainer were presented (see Chapter III). Using the guidelines developed in that document we attempted to produce a proof-of-concept system that would provide simulated visual scenes viewed through an HMD using currently existing technologies. The knowledge gained building the system could be used to determine the capability of the technology and provide some insight as to what may be possible in the near future. The intent was to use commercial off the shelf (COTS) products as much as possible to develop a small scale visual simulation that could be displayed to the trainee with superimposed HUD symbology.

The project was broken up into essentially three parts. An interactive multimedia authoring environment, terrain scene development, hardware and interactivity considerations for the HMD.

A number of commercially available multimedia authoring systems were available. The one chosen, Macromedia's Director 6.0, appears to be one of the most capable on the market. It has an environment in which the author can create an interactive movie. Features include the ability to remove, add or move images around the stage based on external inputs including keyboard, mouse, joystick and voice. Additional capabilities are being added regularly via second source vendors who write pluggins, called Xtras, for Director. From Director movie playback and screen refresh speeds can be controlled. Graphical user interfaces are easily created and then displayed by replaying the same frame over and over until the user chooses to leave the frame for a movie, still picture or another screen.

For terrain development Vistapro 4.0 was chosen. Other scene generation software packages were available but none did exactly the things Vistapro can do. Vistapro allows the user to work on real terrain by using U.S. Geological Survey data and converting it into a virtual world. The scenery can then be populated with a number of terrain features (grass, trees, water etc) and colored in any way the user likes. Vistapro also provides vehicle models, in this case the helicopter model was used, to develop a movie which depicts the imagery along a user described path through the terrain. The movie can be exported in a variety of formats for ease of use.

In addition to a Personal Computer (PC) the HMD is the only one of these three elements that the user would need to acquire to take advantage of a developed ANVIS/HUD training program. The selection of the HMD was more difficult. There are basically three classes of HMD's low, medium and high cost/capability. The low cost/capability ones were ruled out as inadequate for the task. The high cost ones were also ruled out because they were too expensive. Hardware costs tend to come down so their capabilities may be more affordable in the near future. The problem with the medium cost/capability units is that they have a very limited market – namely the serious gamer. The two units we looked at were both manufactured by companies in serious financial trouble. One was actually out of business and the other in Chapter 11. The Forte VFX1 Headgear unit was chosen for several reasons. It incorporated magnetic head tracking, joystick command emulation for the tracking unit, reasonable resolution (640 X 480 pixels), headphones for sound, an independent three-dimensional mouselike input device and optical focusing characteristics (inter-pupillary distance etc.) similar to those found on NVG's. Using the VFX1 is very much like using NVG's mounted on a

pilot's helmet except for the reduced optical resolution. The unit also supports line sequential stereo mode, which the authors determined could be used to present monocular images in a binocular setting.

All of the above hardware and software components were used together to produce a system similar to the one envisioned by Ciavarelli et al in their description of a low cost, PC based, multimedia CBT for NVG training. A more detailed description of system components and procedures used during engineering development will be discussed later in Chapter III.

#### **E. RESEARCH OUTPUT**

The primary goal of this research was to develop a functional framework for developing a multimedia computer-based ANVIS/HUD trainer. The mission was to see if it was possible to build a system using COTS products and a helmet mounted display that would provide the fidelity necessary to simulate use of the ANVIS/HUD in a night environment. The functional prototype resides in the Naval Aviation Safety School Multimedia Lab, Naval Postgraduate School, Monterey, California.

This prototype is a component of an ongoing research and development project and should be viewed and operated in that regard.

#### **F. SCOPE AND LIMITATIONS**

The intent was to demonstrate what level of functionality was achievable with low cost PC equipment, an off the shelf HMD and commercially available software development tools. It should be noted that we did not set out to develop a full spectrum multimedia trainer for fleet use but rather to develop a technology demonstration system

that could be incorporated into a multimedia curriculum that would add significant training value to the baseline ANVIS/HUD trainer.

It was determined that the system should run on an IBM PC based system using the Windows 95/NT operating system since that is what the fleet currently has or was in the process of procuring (IT-21). Due to interoperability of existing systems it could possibly also be run or developed on other systems (i.e. Apple computers or SUN workstations). Using a workstation to run a trainer would have several advantages including higher speeds, available 3D game engines, etc. A number of drawbacks are inherent in using these workstations. Fleet users are not generally familiar with the UNIX operating system. Most fleet software applications are not available for UNIX machines limiting the other uses the machine might have in a small unit with limited resources. The higher cost of the systems makes them less attractive to the fleet.

The developed PC-based trainer demonstrates the interactivity of the HUD symbology with the visual environment. With relatively little training a developer could learn to create new lessons fairly quickly. It was estimated that once a scenario was established, a “movie” could be developed in less than one week.

## **II. BACKGROUND**

### **A. MULTIMEDIA**

Multimedia is the computer controlled integration of text, graphics, still and moving images, animation, sounds, and any other medium where every type of information can be represented, stored, transmitted, and processed digitally. The interface in these systems may permit interactivity to the final user. An interactive multimedia system is an integrated computer controlled environment that allows for the manipulation of digital information. Interactivity is the amount of control the user has over the display and presentation of information. Kirkley (1995) describes the three most common classifications of interactivity:

- A linear presentation is one in which the author decides the sequence and manner in which information is presented. The user controls only the pace.
- A programmed branching program is one in which the user has some control over the sequence of presentation by selecting from a group of choices such as from a main menu. The author still maintains the control of deciding what to include in the choices available at various points in the program.
- Hypermedia can be thought of as a web of interrelated information in which the user is in almost complete control of the pace, sequence and content of the presentation. Links provide a means for random access of information.

How it is generated and their display types classify media. The two means of media generation are synthesized and captured. Computers create synthesized media while captured media comes from the real world and is captured digitally by some

recording device. There are two general multimedia display types, discrete and continuous. Discrete media is space-based. A slide show would be an example of discrete media. Continuous media is both space and time based. Animation and motion video is examples of continuous media. (Xie, 1997)

Multimedia can be combined with computer-assited instruction to make learning highly individualized and interactive (Oblinger, 1992). Interactivity increases the learner's engagement with the learning situation (ED, 1991). These two traits are what make desk-top computer-based training so attractive.

The dynamic nature of multimedia involves many challenges and design trade offs. The main elements of multimedia are text, graphics, images, animation, full motion video, and sound. Each of the media types can be represented in various digital forms that include numerous compression schemes. It is in this arena that the developer needs to determine the balance between media types and user performance requirements. A permanent storage medium is used to keep the digitized information for future retrieval and use. Multimedia requires extensive amounts of storage during both the development and application stages. Bandwidth can be thought of as the pipe through which information flows. The larger the amount of data that needs to be delivered, the bigger the pipe needed. Bandwidth and storage capacity are currently the biggest limitations to delivering large amounts of digital video in multimedia (Kirkley, 1995). When designing a CBT, these performance and storage trade offs directly impact the fidelity and training value of the end product. Incorrect design choices will negatively impact the final product. The authors' prototype is primarily a visual trainer, therefore high fidelity imagery was used. The penalty for this design decision is very large storage

requirements and video run times of only thirty seconds at fifteen frames per second for the non-interactive portions. The interactive video storage requirements reduced run times to eight seconds in length.

Multimedia systems require high speed processing. This is due to the execution speed and large file size that sound and video data demand. In terms of bytes of information, sound and video files are the two largest media types. The current Reduced Instruction Set Computer (RISC) based processors for personal computers provide execution speeds up to 266 megahertz. Moore's law states that processing speed and storage will roughly double every 18 to 24 months and has held true for the last thirty-five years. This trend can be expected to continue. Therefore desktop multimedia systems will increase in speed, power, and fidelity.

The display depth is the systems ability to display an accurate image. Newer computers can display high fidelity images using millions of colors and are approaching photo realistic images. A recent summary of multimedia assessment methods and discussion of technology issues are presented in Nixon's (1997) thesis. Blending the requirements of computing power, data storage and management, human interface usability, latency, and throughput are difficult and necessitate a deep understanding of what the system is to present.

## **B. COMPUTER-BASED TRAINING**

Computer-based training (CBT) uses a computer and software to teach a skill or enhance a student's knowledge base. The CBT environment may be enhanced through the use of multimedia. These interactive programs allow the user to progress through learning objectives at their own pace, and revisit those that are in question. The modules

may include theory, exercises, demonstrations, and exams that offer immediate feed back to the user. Many of these trainers provide a student-tracking feature so that an instructor can monitor a student's progress and supplements instruction when required. Low-end programs are largely text based while higher-end programs take advantage of many multimedia features.

Orlanski (1994) gives a brief summary of a few major substantive finding of interest to military training:

- Computer-based instruction saves about 30 percent of the time students need to complete a course, compared to conventional instruction.
- Interactive videodisc instruction raised performance of 50th percentile students to about the 70th percentile achievement level.
- The average cost of interactive videodisc instruction is about 40 percent that of conventional instruction.

CBT systems are typically dominated by tutorial presentations that have been limited to use of text, graphics, and photographic images. With the tremendous improvement in microprocessor area, it may now be possible to incorporate different media such as video, and interactive simulations. Such enhancements may be particularly useful in depicting portions of the operational world that would improve the training value of a CBT.

Studies by IBM and others indicate that people forget most of what they hear, retain only 20 percent of what they see, 40 percent of what they see and hear, and retain 70 percent of what they see, hear and do (Whitehouse, 1995). Adding embedded simulation is another multimedia element that adds to the richness of the CBT experience

by involving the student at a deeper level in the learning process thus promoting retention. Simulations may be an important adjunct to learning tasks that depend upon more hands on involvement with portions of the operational environment.

The fundamental function of the simulator is to store, process, and display information about a real system and it's operating environment, to which the operator would be exposed if he were operating or practicing in the real world (Stark, 1989). High texture density is a prerequisite for perceiving optical flow discontinuities that define hills and ridges during low-level flight. Terrain contour is an especially salient feature of real-world scenes and should probably be included in simulator scenes. (Kleiss, 1992) The fidelity of the simulated environment is dependent upon the type of learning experience and skill set that the CBT is designed to enhance. The CBT lacks the computing power and fidelity of a simulator, but some elements of simulator technology can be supported within a CBT.

Two central issues dominate the choice between using a CBT, simulator or using actual equipment within the operating environment: the effectiveness and cost of using the CBT or simulator for training versus using the actual equipment for the same purposes. Effectiveness is the level of performance achieved by using artificial means to acquire the skills and training to operate the actual equipment. Cost means all cost, to include life cycle, procurement and operating costs.

The aviation night vision operational environment is a dangerous one. The ability to train for this environment is highly desirable, more so if it can be done effectively at a reasonable cost and with nominal risk. This makes simulators and CBT's attractive. The authors mission was to see if an effective low-cost CBT could be developed that would

support embedded interactive simulation of the night vision environment. Some of the more detailed scene elements were not be able to be presented, given the design decision to develop the system using personal computer COTS products.

### **III. METHODOLOGY**

#### **A. OBJECTIVE**

The Visual Effects Simulation Demonstration (VESD) discussed here is a stand-alone “proof-of-concept” demonstration that operates on an IBM compatible PC running the Windows 95, or above, operating system. The objective of this demonstration was to develop a low fidelity simulation that would ultimately be integrated with a previously computer-based ANVIS/HUD trainer.

#### **B. TRAINING / FUNCTIONAL REQUIREMENTS AND SPECIFICATIONS**

##### **1. Training Requirement**

Earlier development work on the ANVIS/HUD trainer such as that completed by Meza (March, 1995), Kern and Shaffer (March, 1996), and Foster and Price (December, 1996) provide a foundation for specifying requirements for the Visual Effects Simulation Demonstration (VESD). These earlier studies helped establish training requirements specification and to build a baseline ANVIS/HUD trainer. The earlier versions of ANVIS/HUD (discussed by Foster and Price, 1996) incorporated text, graphics, and selected non-interactive video examples. A training feature that incorporated ability for the aviator under instruction to view HUD symbology under dynamic simulated flight conditions was desired. The capability for the trainee to visualize flight over terrain, in even the most rudimentary way, was considered to have much potential benefit to the realism and value of the ANVIS/HUD trainer. The VESD was developed to provide ANVIS/HUD trainees the ability to visualize flight over terrain while viewing dynamic changes in HUD symbology. For example, the trainee could use the VESD to observe

the effects of display clutter, by toggling selected symbology ON/OFF during the flight over terrain interactive movie demonstration.

## **2. Functional Specifications**

The functional specifications for the demonstration were based upon a report by Ciavarelli, Baer and Sengupta (December 1994). The following table, extracted from this report, served as our initial functional specification for constructing the demonstration:

**Table 3.1 Desired Functional Capabilities of a Part-task Visual Simulator**

### **1. DISPLAY DYNAMIC OUT OF COCKPIT SCENES**

- Provide selectable terrain variations
- Provide selectable illumination levels
- Generate artificial light effects
- Generate atmospheric attenuation effects
- Generate aircraft lighting effects

### **2. DISPLAY BASIC FLIGHT INSTRUMENTS**

- Display primary flight instruments
- Display selected engine/other instruments
- Generate auditory and visual warnings

### **3. PROVIDE BASIC FLIGHT CONTROLS**

- Provide manual control inputs (Joystick, Throttle)
- Provide control and display inputs
- Provide aerodynamic response

### **4. PROVIDE INSTRUCTOR OPERATOR CONTROL**

- Provide scenario construction and storage

- Provide pre-programmed flight profiles
- Provide Instructor Controls and Displays

Functional capabilities for the VESD were selected from Table 3.1 and implemented using the PC hardware and software systems described above, and following procedures as outlined next.

## **C. HARDWARE AND SOFTWARE DESIGN**

### **1. Hardware**

The hardware consisted of an IBM Compatible PC, manufactured by Micron Inc., and the VFXI<sup>TM</sup> Helmet-mounted Display (HMD) manufactured by Forte Technologies. The PC was a 266 Mhz Pentium Pro II, configured with 128 megabytes of RAM and a 6.4 gigabyte hard disk drive. A Hercules Dynamite<sup>TM</sup> 128/4-video card was selected as the most compatible video card to be used with the HMD.

The HMD came equipped with its own ISA compatible circuit card. A VESA bus connector is used to link the VFXI card directly to the VESA feature connector on the video card. The helmet includes two LED viewing devices and headphone speakers linked to the computer via the VFXI card. The HMD is capable of displaying a screen resolution up to 640 by 480 pixels at 60Hz refresh rate. Detailed specifications for the VFXI HMD are presented in Appendix A.

### **2. Software**

Vista pro 4.0<sup>TM</sup>, manufactured by Romtech was used to generate Night Vision Goggle (NVG) scenes. This software program has the capability of importing Digital Elevation Models (.dem files) produced by the U.S. Geological Survey. Vista Pro can be used to create images populated with user selected terrain cover and user defined color

schemes. The software also allows the user to specify a route through the terrain, to select a type of vehicle to be used, and to specify the number of frames per second needed to create a series of bitmap images.

Following generation of sample visual scenes, the demonstration itself was created using Macromedia's Director 6.0™ multimedia authoring suite. This software has the capability, among other authoring features, to create interactive movies. DirectControl™ from DirectXtras was used to provide joystick capability to Director 6.0™. The entire Visual Effects simulation for the ANVIS/HUD CBT was developed as a set of interactive movies using the movie creation feature.

#### **D. SYSTEM DEVELOPMENT PROCEDURES**

The development capabilities of Vista Pro and Director 6.0™ are clearly specified in the software documentation, and adequately cover topics related to the construction of images, importing images, creating movie sequences, and the use of text and graphics editors used in the construction of a demonstrations such as that created for this thesis project. The following outlines the steps used in the construction of the VESD:

##### **1. Creation Of Background Imagery**

Using Vistapro, the following steps were used to construct the movie background imagery for the demonstration:

- Open the terrain to be viewed (. dem file).
- Select the color option and turn all colors to green to approximate ANIVIS-9 imagery for all terrain textures and tree types.
- Select lighting and environmental conditions as desired. Define flight path to be flown by helicopter (by specifying selectable waypoints). On the Path

menu the Speed needs to be calibrated to the desired airspeed. Using a conversion factor of 50.8 cm/(seconds \* Knots) converts speed in knots and frame rate in frames per second (fps) to centimeters between frames, which are the required units for this field. An airspeed of 150 Knots at a frame rate of 15 fps converts to:

$$3.1 \quad 150 \text{ Knots} * 50.8 \text{ cm}/(\text{seconds} * \text{Knots}) / 15 \text{ fps} = 508 \text{ cm/frame}$$

- Select image size, which in this case is very critical. The HMD limiting dimension is 480 pixel height that must correspond to a 40 degree field-of-view. Therefore width was also constrained to 480 pixels. In order to calibrate the image to achieve angular correlation between head movement and image movement the following computation was necessary:

$$3.2 \quad 480 \text{ pixels} / 40 \text{ degrees} = 12 \text{ pixels/degree}$$

The image size was chosen to be 90 degrees wide by 60 degrees high, thereby yielding

$$3.3 \quad \text{Height} = 90 \text{ degrees} * 12 \text{ pixels/degree} = 180 \text{ pixels}$$

$$3.4 \quad \text{Width} = 60 \text{ degrees} * 12 \text{ pixels/degree} = 720 \text{ pixels}$$

- Animate a bitmap (. bmp) series of images at 15 frames per second.
- Save and print the script file from the run.

## **2. Movie Generation**

Using Director 6.0<sup>TM</sup>, import imagery into a movie cast as a 32-bit color image as follows:

- Create a new eight bit custom color green scale palette in Director for use by converting images from 24-bit color Vistapro bitmaps to eight bit color

image. This step was done in the Director's Paint program. A custom palette was defined by setting the central color (Number 126) to the RGB values corresponding to the wavelength emitted by the p-40 phosphor, 560 nanometers, used in the ANVIS-9 image intensifying tubes (Red = 180, Green = 255, Blue = 0). The color zero was defined as white and color 255 was defined as black. Using the blend function, tints and shades of the central color (from white to black) were created to fill the rest of the palette.

- Transform each bitmap image from 32-bit color to eight bit color. This transformation achieves a near lossless compression of approximately three to one from the original image, and results in a closer correlation of the imagery colors to the ANVIS-9 environment.
- Create each HUD symbol component using a graphic editor, import each symbol into the cast and transform them to the custom palette.
- Select a black stage with dimensions 480 by 480.
- Import the entire bitmap series of background images into the score of the movie using the cast to time feature.
- Create a black mask with a white center circle to place over the movie on the stage to give the round appearance of the ANVIS-9 tubes. Lingo commands to respond to HMD movement were attached to this particular cast member.
- The HUD symbology was then animated to correspond to the actions in each frame, using the Script file from the Vistapro run.
- Lingo script was added to control the movie and interaction. (See appendix B).

- A menu-driven user interface was developed to allow the user to set preferences and to operate the movie sequence.
- A stand alone executable “projector” was created.
- Reset the system display to 60Hz, 256 color, 640 X 480 mode.
- View movie through the headset (or use SVGA monitor).

## **IV. RESULTS AND DISCUSSION**

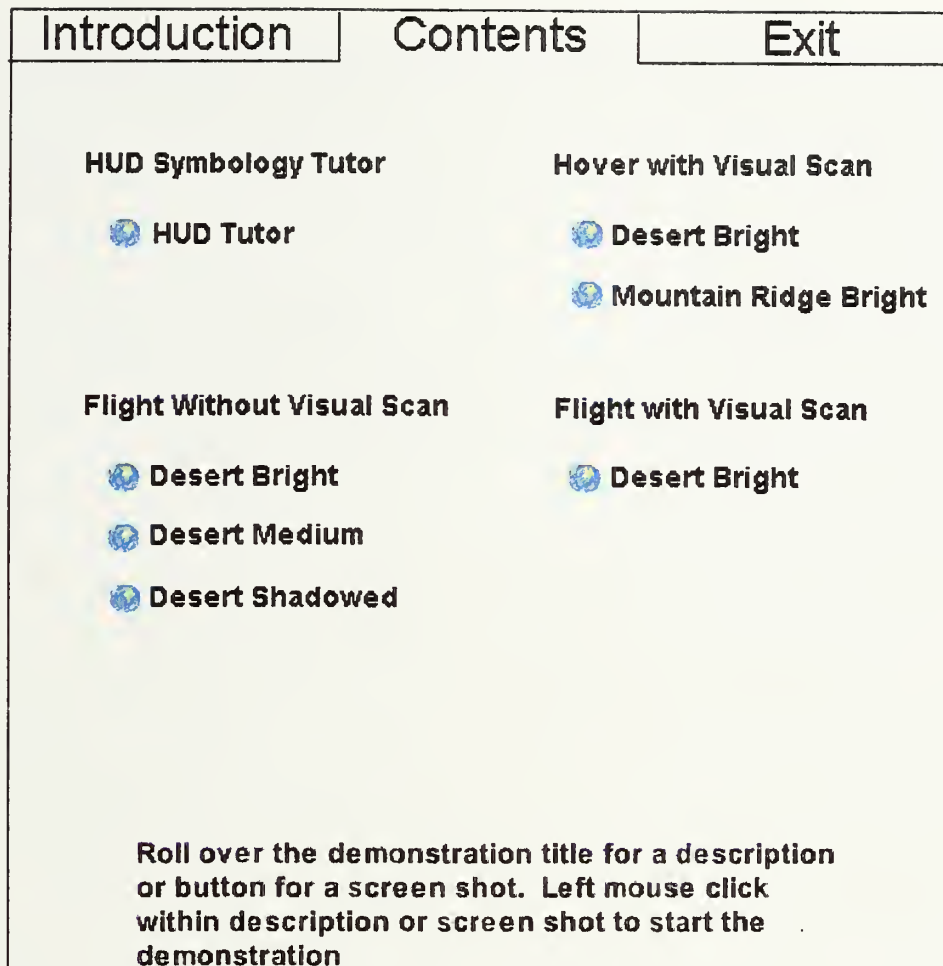

### **A. OVERVIEW OF VESD TRAINER**

The demonstration was designed to run on an IBM compatible computer running Windows 95 or above. The hardware configuration suggested for use of the demonstration is a Pentium Pro II 266 MHz processor with 128 Mbytes RAM and at least 1.5 Gigabytes of available hard disk space. Use of the Hercules Dynamite™ 128 video card is recommended in order to meet HMD compatibility requirements. The demonstration can be viewed on an SVGA monitor, as well as the recommended HMD (Forte VFX1).

The demonstration was constructed to include several different modes of operation, and with different terrain and light scene combinations. Figure 4.1, shows the user selections available on the demonstration. The demonstration includes, (1) HUD Symbology Tutor (2) Flight without visual scan (3) Hover with Visual Scan, and (4) Flight with visual scan. As shown in Figure 4.1, the user may select various visual scene options. For example, under Flight without visual scan the user may select Desert Bright, Desert Medium or Desert Shadowed. A mountain ridge scene option is provided under the Hover with visual scan mode. Figures 4.2 and 4.3 show snapshots of Desert Bright, and Mountain Ridge Bright scenes.

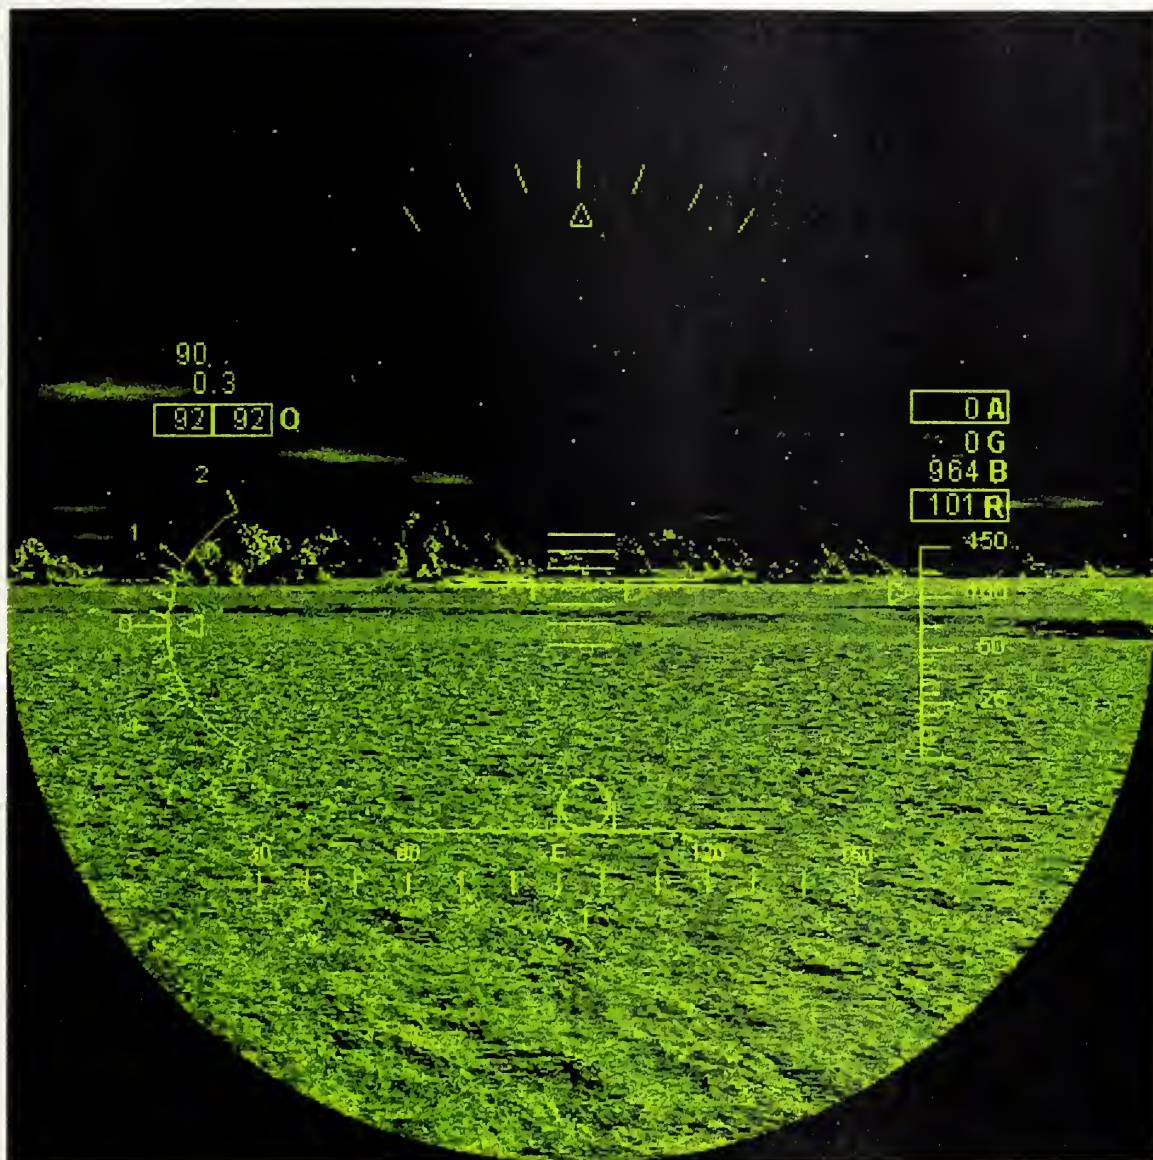

The main thrust of this thesis project was to develop out-of-cockpit scenes, and to superimpose ANVIS/HUD symbology. However, during the course of our development we added the HUD symbology Tutor that can be used to review the location

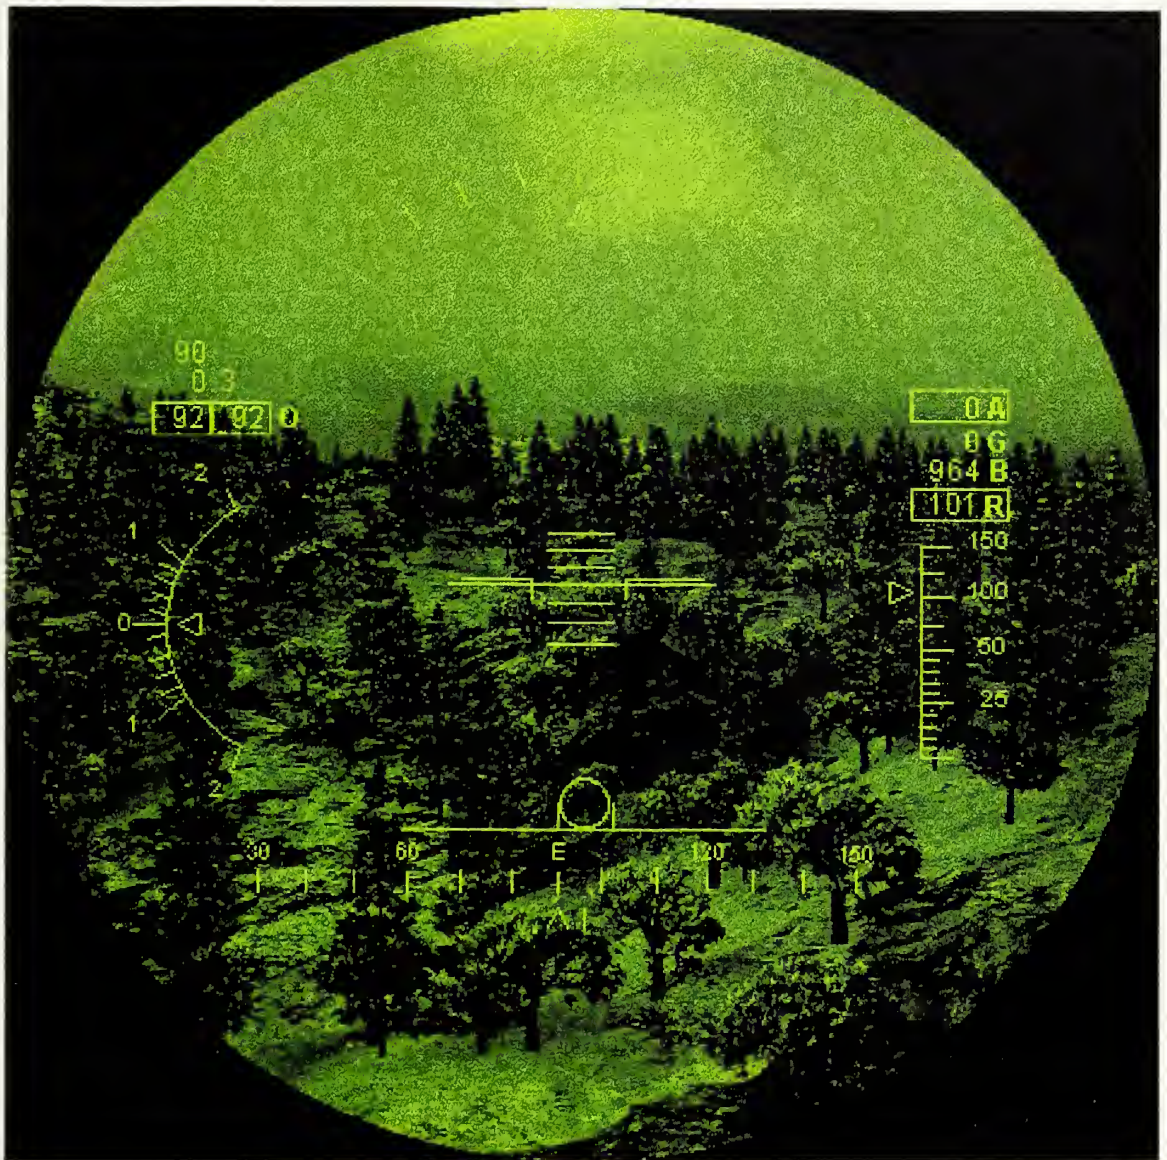

**Figure 4.1. Main Menu of Flight Options**

and function of ANVIS/HUD symbols. The HUD Tutor was developed as a Shockwave™ application for use over the World Wide Web. The Tutor demonstration shows an image of the entire HUD symbology set. The user can obtain a description of any HUD symbol by moving the mouse cursor over a particular symbol. Figure 4.4 shows the HUD Tutor Symbology display screen.

## **B. OPERATION OF THE DEMO**

The setup and software configuration instructions are presented in Appendix C. From the User's point of view, the Visual Effects Simulation Demonstration begins with the CONTENTS screen, presented in Figure 4.1. The user selects an option from the menu tabs presented in this figure. Tabs for three pages are presented: **Introduction**,

**Contents**, and **Exit**. The Introduction is a brief overview of the program. The Contents is a list of movie clips available with a set of hot links to executable files. Each movie selection is indicated by a button and text name. Rolling over the button causes a screen shot thumbnail of the movie scene to pop up and rolling over the text causes a short text description of the movie to pop up. The user selects a particular movie by clicking the mouse on either the text or movie thumbnail image. Each movie clip has a text description associated with it, and represents a particular lesson module. After the user is done reading the movie's text, the user can select the HUD symbology screen by left clicking on the mouse. The HUD Symbology Selection Screen is presented in Figure 4.5. The user can toggle various selected symbology items on or off. Symbols turned off will not display during the movie sequence. The HUD symbology selection screen can be activated any time during the movie presentation. The user starts the movie by clicking on the screen the **Start** or **Resume** screen controls shown in Figure 4.5. Instructions for later interaction with the movie are displayed while the movie file is loading, as shown in Figure 4.6.

If the user intends to view the movie with the HMD, then this is a good point in the process to lower the HMD goggles and keep a hand on the mouse. During the movie the mouse should not be moved. Moving the mouse while the movie is playing will cause the mouse cursor to move from the movie stage. Once off this stage, the mouse will not be active as control input while the movie is running. With the mouse in a fixed position, and cursor on stage, the user can pause the movie by clicking down and holding the right mouse key. The user may also return to the symbology selection screen by a left mouse

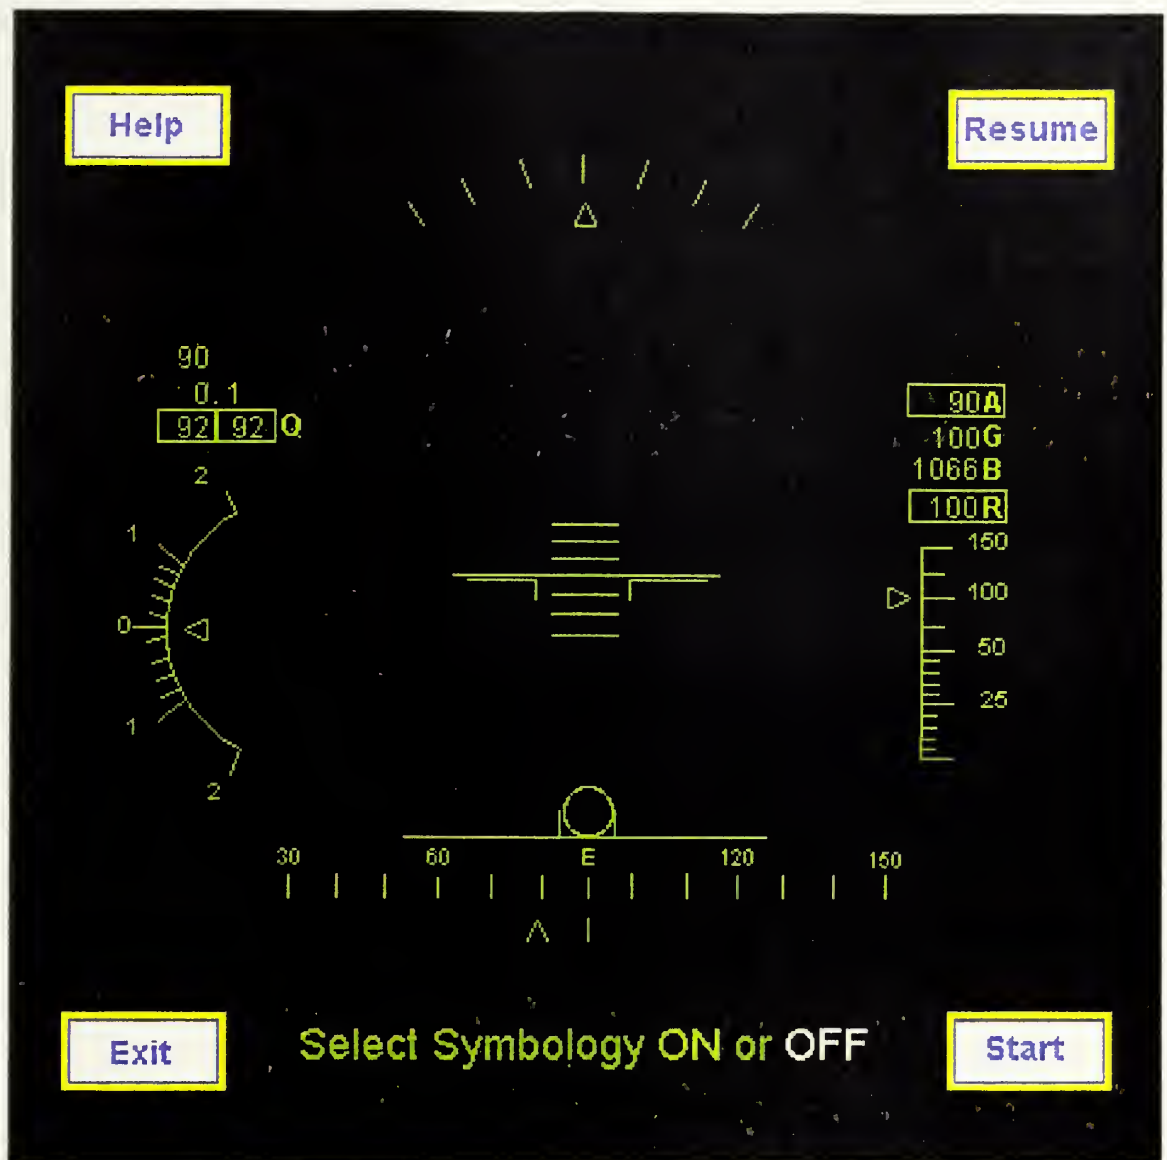

Figure 4.5. HUD Symbology Menu

**While the flight is loading into memory make sure the helmet mounted display is on and that the goggles are down.**

**The movie will start automatically in about twenty seconds. If at any time during the flight you would like to change the symbology, left click the mouse on the screen. If you want to pause the action, depress the right mouse button. Release of that button resumes action.**

**Figure 4.6. Instructions for Interactive Flight**

click. Once back to the symbology screen, the user can re-configure the movie for another run. The user may also exit the movie from this particular screen.

As mentioned in the overview, there are various modes of operation in the VESD. If the movie is running in an interactive mode the user will be able to scan the image within the field of view of the movie presentation window. As in ANVIS, a 40 degree field of view is presented. The total available scene is 90 degrees horizontal and 60 degrees vertical. If the HMD is properly calibrated and the user begins the movie looking straight ahead, then the image will be centered on the screen. Head movements up, down, left or right will produce corresponding changes in the image being viewed. Visual scan is available in both Flight and Hover movie selections, but this feature reduces the flight length to about eight seconds.

### **C. LESSONS LEARNED**

During the course of producing the VESD a number of limitations were encountered and tradeoffs were made.

The Director 6.0<sup>TM</sup> authoring environment was initially developed to produce QuickTime<sup>TM</sup> videos for the Apple environment. A vestige of that frame of reference is that Director only plays back images in bitmap (.bmp) format. Bitmaps require the most storage space of any available image format. If Director could take advantage of some form of compression it would greatly decrease disk access time. This is significant because it appears that Disk access time is the primary limiting factor in playback speed. In order to achieve continuous (no jitter) playback the entire movie must be able to be loaded into RAM or the images must be small enough and the playback rate slow enough to allow run time retrieval. Director also has no ability to conduct more than one process

simultaneously. It would be desirable if Director could look-ahead and fetch the next frame not yet in memory as soon as it has executed a frame that will not be displayed again while it is displaying other images. Currently refresh rates of 28 frames per second are achievable for the interactive flight in this demonstration using the recommended system configuration. Due to the requirement to have all of the frames loaded into memory only about eight seconds of 15 fps video can be loaded into the available RAM. Because the hover flights only display a single frame, higher refresh rates (60 Hz) are achievable.

It was found that the generation of bitmap sequences for the background imagery using Vistapro could not be done on multiple computers for the same route. Consistent image registration for sequences of imagery generated on other computers is not guaranteed. The entire sequence must be generated on a single machine.

## **V. CONCLUSIONS AND RECOMMENDATIONS**

### **A. CONCLUSIONS**

Given the current state of technology it is possible to develop small-scale simulation on a Personal Computer. Using low cost software we were able to produce reasonably good quality NVG and HUD imagery that could be animated to produce a somewhat lifelike simulation.

The primary limitation in developing and running the application proved to be storage and access. Because Director can not generate a request for imagery while it is performing other functions the program must wait for imagery when it needs it. This directly impacts playback performance as soon as the imagery stored in RAM is exhausted. If imagery could be stored in a compressed format it would require less time to retrieve. This would be helpful as long as expansion was reasonably fast. Again if Director could take advantage of the parallel processing capability under Windows 95 this could be done while imagery is being displayed or manipulated. Given the large size of bitmap format files even disk storage becomes a factor. The fully interactive module with only about 15 seconds of imagery requires nearly 100 Megabytes of memory. At that size only about six or seven modules could be stored on a single CD ROM uncompressed.

The VESD definitely has the capability of giving the user a good idea of what HUD symbology looks like when superimposed over terrain in an NVG environment. The ability to experiment in a safe and controlled environment with different levels of HUD symbology decluttering is clearly offered. It also has the capability of being run on

systems that would be available in the squadron environment. The VESD could prove to be a valuable addition to current ANVIS/HUD CBT systems.

Incorporation of the VESD into the ANVIS/HUD trainer would allow fleet units to experiment with the HUD symbology in a safe, low cost, high availability environment. Given additional advances in technology we may no longer need a dark room, good weather, nighttime, expensive equipment or an aircraft to play with different configurations of the HUD symbology. The total cost of this system was a fraction of the cost of a single ANVIS-9 unit.

## **B. RECOMMENDATIONS**

During the course of development it was not possible to fully explore all of the avenues available as fully as we would have liked. Some of the more interesting areas that we could not explore are discussed here.

- Use a higher speed personal computer. 300 MHz Pentium Pro II computers running on 100 MHz motherboards should be available soon. Combining a faster computer with a faster storage retrieval system would increase performance. The use of RAID (Redundant Array of Inexpensive Disks) technology may improve retrieval rates. If the per frame retrieval rate could be increased sufficiently the only limitation to the length of the flight would be moved from the amount of RAM to the size of the hard disk.
- Add voice explanations to the audio track to point out or explain scene elements. Voice instruction can also describe various HUD symbology display mixes given the prevailing lighting conditions and environmental type.

- Voice recognition Xtras (modules) are available for Director 6.0<sup>TM</sup>.

Incorporating the capability to provide hands free operation might be useful.

This would be significantly easier while wearing the HMD. Since voice recognition is computationally intensive it would most likely require sacrifices in image processing.

- Develop the system from scratch using a package that allows the programmer to have greater control over memory management and to optimize code for greater processing efficiency.
- There are second source plug-ins that allow Director 6.0<sup>TM</sup> to access three-dimensional imagery. The possibility of having a 360 degree viewing area would increase the realism of the simulation
- This application could be developed for use over the World Wide Web. Director 6.0<sup>TM</sup> applications can be converted to Macromedia's own Shockwave format that works very well on the WWW. The application would require significant bandwidth to run but we believe that the internet bandwidth limitation will ultimately be overcome.
- Use a better HMD to get better resolution. The trend in hardware costs is to come down. A higher quality resolution HMD may be available in the near future at costs similar to the present cost of the VFX1.

Continued development of demonstrations like this one that depict night vision scenery may ultimately lead to transportable desk-top trainers. Such devices, given advances in technology, may be a valuable adjunct to the Navy's night vision training program. For example, if visual simulator fidelity improves in such desk-top trainers,

some of the NITE lab demonstrations may be possible to do “electronically”. Other future applications include use of such simulation in the night vision introductory and refresher courses.

## **APPENDIX A. FORTE VFX1™ SPECIFICATIONS AND REQUIREMENTS**

### **3D Stereoscopic Flip-Up Visor**

- With focus and IPD adjustments
- High contrast color video
- Dual 0.7" color liquid crystal displays
- 789(RGB) x 230 resolution x 2 263 x 230 True Pixels
- 181,470 pixels
- 256 Colors
- Works with existing, standard VGA applications
- Optics
- Field of view:
  - 26.4 degrees vertical
  - 35.5 degrees horizontal
  - 45.0 degrees diagonal
- High quality color corrected optics
- 45 degree field of view
- Provides large screen stereoscopic imaging
- Virtual Orientation System (VOS) Sourceless Head Tracker
- 60Hz Refresh Rate (60 times per second)
- With three degrees of freedom:
  - Yaw (azimuth): 360 degrees
  - Pitch (elevation): +/- 70 degrees

- Roll (tilt): +/- 70 degrees
- VFX1 HEADGEAR Interface Protocol (VIP) Card
- Interfaces with standard VGA card and sound card
- Includes ACCESS.bus host
- Connect up to 125 different devices
- Does not require serial port connection

### **CyberPuck Controller**

- Left or right-handed control
- ACCESS.bus device
- 3 programmable buttons

### **High Quality Stereo Headphones**

- Designed by AKG of Austria
- 20 Hz - 20 kHz
- Stereo and 3D sound capable

### **Comset Microphone**

- Hands free communication
- Gamer to gamer
- Voice recognition capable

### **Ergonomic Design**

- Comfort
- Control
- Extended use

## **Power Requirements**

- 5 volts, 2.0 watts
- 0.4 amps (with Cyberpuck controller)
- Does not require external power sources

## **System Requirements**

- IBM PC or compatible, 386, 486 or Pentium
- Video card (VGA minimum) with 100% VESA Standard Compliant Feature Connector
  - ISA
  - VLB
  - PCI
- Free ISA Expansion Slot
- Does Not use a COM/Serial Port
- One Free Base Port (choices):
  - 260
  - 280
  - 2A0
  - 2C0
- One Free IRQ (choices):
  - 5
  - 7
  - 10
  - 11
  - 12
  - 15

- Stereo sound card (for audio)

## APPENDIX B. LINGO SCRIPT

The following is a complete listing of the Lingo Code for the modules Hudmain and Interactive. Hudmain is the menu from which modules are chosen. Interactive is the flight with full HMD interactivity. The code for the other modules is very similar to the code in one of these two modules, primarily Interactive.

### A. Lingo Script for Interactive (Desert Bright with Visual Scan)

#### Script 2 Begin

```
on exitFrame
    go to "Beginning"
end
```

#### Script 3 Go To HUD Menu

```
on mouseUp
    go "Hud Menu"
end
```

#### Script 6 Set Stage & Preload Flight

```
on enterFrame

    set the visible of sprite 24 to gAttitude
    set the visible of sprite 25 to gAttitude

    set the visible of sprite 8 to gRoll
    set the visible of sprite 9 to gRoll

    set the visible of sprite 27 to gBarAlt
    set the visible of sprite 28 to gBarAlt
    set the visible of sprite 29 to gBarAlt
    set the visible of sprite 30 to gBarAlt

    set the visible of sprite 11 to gBall
    set the visible of sprite 12 to gBall

    set the visible of sprite 44 to gDigWayPt

    set the visible of sprite 14 to gDigRadAlt
    set the visible of sprite 15 to gDigRadAlt
```

```

set the visible of sprite 32 to gAirspeed
set the visible of sprite 33 to gAirspeed

set the visible of sprite 35 to gGroundSpd
set the visible of sprite 36 to gGroundSpd

set the visible of sprite 38 to gTorque
set the visible of sprite 39 to gTorque
set the visible of sprite 40 to gTorque
set the visible of sprite 41 to gTorque
set the visible of sprite 42 to gTorque

set the visible of sprite 46 to gTimeToGo
set the visible of sprite 47 to gTimeToGo
set the visible of sprite 48 to gTimeToGo

updatestage
unload
preload 10, 260
end

on exitframe
  go to frame 10
end exitframe

```

## Script 15 RadAlt Toggle

Global gRadAlt

```

on mouseDown

  puppetSound "click"

  if gRadAlt = True then

    set gRadAlt = False
    set the memberNum of Sprite 5 to 699
    set the memberNum of Sprite 6 to 692
    puppetSprite 5, True
    puppetSprite 6, True

  else

```

```

        set gRadAlt = True

        puppetSprite 5, False
        puppetSprite 6, False

    end if

    updatestage

    startTimer
    repeat while the timer < 15
        nothing
    end repeat

    puppetSound 0

end mouseDown

```

### Script 32 Circle

```

Global gCurrentFrame, gPause, HMD_Center_X, HMD_Center_Y
Global Window_Size, Pixel_Factor

on mouseUp

    set gCurrentFrame = the Frame

    --remember the frame from which the
    --user leaves the movie to return to the HUD symbology menu
    --By clicking anywhere on the screen the user
    --will be returned to the symbology selection menu

    go to "HUD Menu"
end

--The following script implements a PAUSE to the movie that
--retains interactivity. It is executed on RIGHT MOUSE DOWN

on RightMouseDown

    set gPause to True --Request to Pause is set true

end OnRightMouseDown

```

on exitFrame

set HMD\_X = joyGetPos (1,1) -- get the X coord of headset  
set HMD\_Y = joyGetPos (1,2) -- get the Y coord of headset

set the locH of sprite 1 to ((HMD\_X - HMD\_Center\_X)/Pixel\_factor) +  
Window\_Size  
set the locV of sprite 1 to ((HMD\_Y - HMD\_Center\_Y)/Pixel\_factor) +  
Window\_Size

if gPause Then

go to the frame --While pausing keep displaying the same frame

end If

end onexitframe

on RightMouseUp

set gPause to False --Turn off request for Pause

end OnRightMouseUp

#### Script 34 Initialize Variables

Global gCompass, gRadAlt, gVSI, gAttitude, gRoll, gBarAlt, gBall, gWayPt  
Global gDigRadAlt, gDigWayPt, gAirspeed, gGroundSpd, gTimeToGo  
Global gTorque, gCurrentFrame  
Global Window\_Size, Pixel\_Factor, HMD\_Center\_X, HMD\_Center\_Y  
Global gPause --vairable to pause movie during execution

on EnterFrame

set gPause to False --Movie is NOT PAUSED at the beginning  
set gCompass to True -- Set Compass to be displayed  
set gRadAlt to True

on mouseUp
    set the memberNum of Sprite 5 to 12
    updatestage
    startTimer
    repeat while the timer < 30
        nothing
    end repeat
    puppetSprite 5, False
    puppetSound 0

end mouseUp

```

#### Script 64 Exit Button

```

--Exit Button control

on exitframe
    if rollOver (6) then
        puppetSprite 6, True
        set the memberNum of Sprite 6 to 16
    else
        set the memberNum of Sprite 6 to 15
        puppetSprite 6, False
    end if
    updatestage
end

on mouseDown
    puppetSprite 6, True
    set the memberNum of Sprite 6 to 17
    puppetSound "click"
    updatestage
    go to "Exit"
    startTimer
    repeat while the timer < 30
        nothing
    end repeat
end mouseDown

on mouseUp
    set the memberNum of Sprite 6 to 15

```

```

updatestage
startTimer
repeat while the timer < 30
    nothing
end repeat
puppetSprite 6, False
puppetSound 0

end mouseUp

```

#### Script 65 Hud Tutorial Control

```

--Plays the hud tutorial movie

on MouseDown
    puppetsound "click"
end

on mouseUp
    set the memberNum of Sprite 22 to 24
    puppetSprite 22, False
    set the memberNum of Sprite 23 to 43
    puppetSprite 23, False
    puppetsound 0
    cursor -1
    go to "Movie Jump"
    Play movie "Demo"
End

```

#### Script 66 Desert Bright Interactive

```

--Plays the interactive Desert Bright movie

on MouseDown
    puppetsound "click"
end

on mouseUp
    set the memberNum of Sprite 7 to 25
    puppetSprite 7, False
    set the memberNum of Sprite 8 to 43
    puppetSprite 8, False
    puppetsound 0
    cursor -1

```

```
go to "Movie Jump"
Play movie "Interactive"
End
```

#### Script 67 Desert Bright Noninteractive

--Plays the noninteractive Desert Bright Movie

```
on MouseDown
  puppetsound "click"
end
```

```
on mouseUp
  set the memberNum of Sprite 14 to 25
  puppetSprite 14, False
  set the memberNum of Sprite 15 to 43
  puppetSprite 15, False
  puppetsound 0
  cursor -1
  go to "Movie Jump"
  Play movie "Bright Desert"
end
```

## APPENDIX C. INSTRUCTIONS FOR SETUP OF DEMONSTRATION SYSTEM

### A. SYSTEM REQUIREMENTS

Recommended:	Computer	Pentium Pro II 266 MHz
		128 Mbytes RAM
		1.5 Gbytes of available Hard Disk space
		Sound Card
		External Speakers
		Microphone
		Forte VFX1 Headgear HMD
		Hercules Dynamite™ 128 Video Card
	Software	Windows 95
		Demonstration Projector (executable file)
		Demonstration modules (listed below)
		DirectControl Xtras for viewing

The demonstration can be run on slower systems with less memory without an HMD. The HMD provides for a more life-like medium for viewing the imagery. A slower system will likely run at a frame rate significantly slower than intended. Significant lag in panning the scenes will occur on slower systems. Using the recommended system allows playback to occur at higher and more desirable playback rates thus providing a higher refresh rate and minimizing update lag.

## **B. SET UP AND CONFIGURATION FOR THE RECOMMENDED SYSTEM**

1. Ensure that the most current drivers and bios are being used for all installed hardware. Contact the manufacturer for verification. These will deliver the best performance for your system.
2. Remove the current video card and install the Hercules Dynamite™ 128 video card. (For a list of video cards compatible with the VFX1 contact Forte).
3. Install the VFX1 VIP card in accordance with the manufacturer's instructions. Attach the HMD to the computer as per the instructions. All setup and calibration instructions should be followed. The VFX1 joystick driver should be installed on joystick number one and the puck should be installed as joystick number two and calibrate.
4. Copy the demonstration projector, main.exe and associate files into a single directory.

<u>Name</u>	<u>Description</u>
Main.exe	Main menu/startup screen
Tutor.dir	HUD tutorial movie
Bright Desert.dir	Flight over highly illuminated desert terrain
Medium Desert.dir	Flight over moderately illuminated desert terrain
Desert Shadow.dir	Flight over desert terrain with low angle moon
Desert Hover.dir	Hover over desert terrain, allows HMD pan
Mountain Hover.dir	Hover over mountainous terrain, allows HMD pan

Interactive.dir

Flight over desert terrain, allows HMD pan

Xtras

A directory containing the Direct Control Xtra  
file names, D Ctrl\_R.x32 and D Ctrl\_R.x16

5. Change the resolution of the screen to 640 X 480, 256 color and 60 Hz refresh rate.
6. Disable all background jobs including virus detectors etc.
7. If an instructor or external observer will be present it is useful to turn on the system microphone and adjust the volume so he can communicate with the HMD user. The sound track that is part of the multimedia experience obscures external noises for the HMD user.
8. Open the **VFX1 calibration** program and ensure that none of the options are checked on. At this point the user should don the HMD and face in the direction he would like to be forward. Care should be exercised to ensure that the area around the user is free of obstruction and that the user is seated for safety. The safety notes from the VFX1 instruction manual should be followed. Click on Set Zero to establish this position as the null (forward) position. Take a few minutes to focus the goggles at this point. After the goggles are focused flip them up until instructed by the VESD program to put them down.
9. Run the demonstration projector (main.exe) file.

## INITIAL DISTRIBUTION LIST

1. Defense Technical Information Center..... 2  
8725 John J. Kingman Rd., STE 0944  
Ft. Belvoir, VA 22060-6218
  
2. Dudley Knox Library..... 2  
Naval Postgraduate School  
411 Dryer Rd.  
Monterey, CA 93943-5101
  
3. Tung Bui, Code SM/SE..... 1  
Department of Systems Management  
Naval Postgraduate School  
Monterey, CA 93943-5002
  
4. Anthony Ciavarelli, Code 10 ..... 2  
Aviation Safety Programs  
Naval Postgraduate School  
Monterey, CA 93942-5002
  
5. Commander Naval Air Systems Command..... 2  
(PMA-205) Training Systems  
1421 Jefferson Highway (JP-1, Rm. 306)  
Arlington, VA 22243-1205
  
6. LT G. Thomas Foggin IV..... 1  
710 Eighth St. N.E.  
Washington D.C. 20002-3604
  
7. LT Paul J. O'Rourke..... 1  
251 Windmill Road  
West Seneca, NY 14218
  
8. Joseph C. Antonio, M.D..... 1  
Human Resources Directorate  
Aircrew Training Research Division  
6001 So. Power Road, Bldg. 558  
Mesa, AZ 85206-0904
  
9. Marine Aviation Weapons and Tactics Squadron One..... 1  
Box 99200  
Yuma, AZ 85369-9200
